Smart Content Summarizer

A Google Opal workflow that retrieves webpage content, summarizes it according to user instructions, and displays the result in a readable Markdown report.

Project Overview

Smart Content Summarizer demonstrates a multi-step workflow that combines user input, webpage retrieval, AI-powered summarization, and formatted output.

Features

- Accepts custom summary instructions.
- Accepts an article URL.
- Retrieves webpage content using the connected Get Webpage tool.
- Generates summaries according to user requirements.
- Displays the original source URL as a clickable link.
- Presents the summary and original content in separate sections.
- Uses Markdown for readable output.

Workflow

1. **User Instructions** — collects length, format, language, tone, and detail preferences.
2. **Get Content Source** — collects the article URL.
3. **Fetch content** — retrieves webpage text using the connected tool.
4. **Generate Content Summary** — summarizes the retrieved content using the user's instructions.
5. **Render Summary Webpage** — displays the instructions, source, summary, and original content.

Repository Structure

```
None

└── README.md
```

How to Test

1. Open the SummaSmart app in Google Opal.
2. Enter summarization instructions, such as:
   "Summarize the webpage in exactly 3 bullet points using simple English."
3. Enter a publicly accessible article URL, such as `https://example.com`.
4. Submit the inputs and wait for the workflow to finish.
5. Verify the summary against the original content.
6. Check that the final page displays the user instructions, source link, summary, and original content.

Current Test Status

The example.com test successfully generated a three-bullet summary and displayed the source link, user instructions, and original content.

A Wikipedia test failed during Preview with "Oops, something went wrong." The cause remains under investigation. Retrieval error handling also requires further testing.

See testing_plan.md for the test cases and recorded results.

Limitations

- Retrieval depends on the connected tool and the accessibility of the target webpage.
- Some websites may block automated retrieval or require authentication.

- Generated summaries may omit context or contain errors; verify important claims against the source.
- Markdown output does not automatically provide advanced interactive controls or custom CSS.

Deliverables

- Google Opal workflow.
- Prompt files and project documentation.
- Public GitHub repository.
- Project explanation video showing the workflow, configuration, tests, and final output.

Author

Created as a learning project for the Smart Content Summarizer (Topic 1) assignment.
